UVX

Historical overview

-
- | | |
|----------------------|---|
| Jan 1987 to Jun 1997 | <ul style="list-style-type: none">• UVX, a 1.4 GeV synchrotron light source is designed, built and commissioned from scratch. |
| 2006 | <ul style="list-style-type: none">• LNL S starts discussions on a new 3 GeV synchrotron |
| Dec 2008 | <ul style="list-style-type: none">• MCT approves budget for conceptual design. |
| 2009 | <ul style="list-style-type: none">• Two workshops: scientific case and machine parameters.• Conceptual design and prototype work starts. |
| 2010 | <ul style="list-style-type: none">• Improvements of the LNL S engineering infrastructure.• Design and prototype work. |
| 2011 | <ul style="list-style-type: none">• Lattice design optimization.• MCT approves project.• Internal discussion on candidates for phase 1 beamlines |
| 2012 | <ul style="list-style-type: none">• 1st Machine Advisory Committee (Machine Redesigned: TBA → 5BA)• 1st Beamline Advisory Team Meeting (Spectroscopy)• New low emittance design, new location, new building layout. |
-

Sirius @ LNL campus

- First discussions in 2006
- Project approved by MCT in 2011

- Budget

- Building USD 100 M
- Accelerators USD 100 M
- 13 beamlines USD 120 M

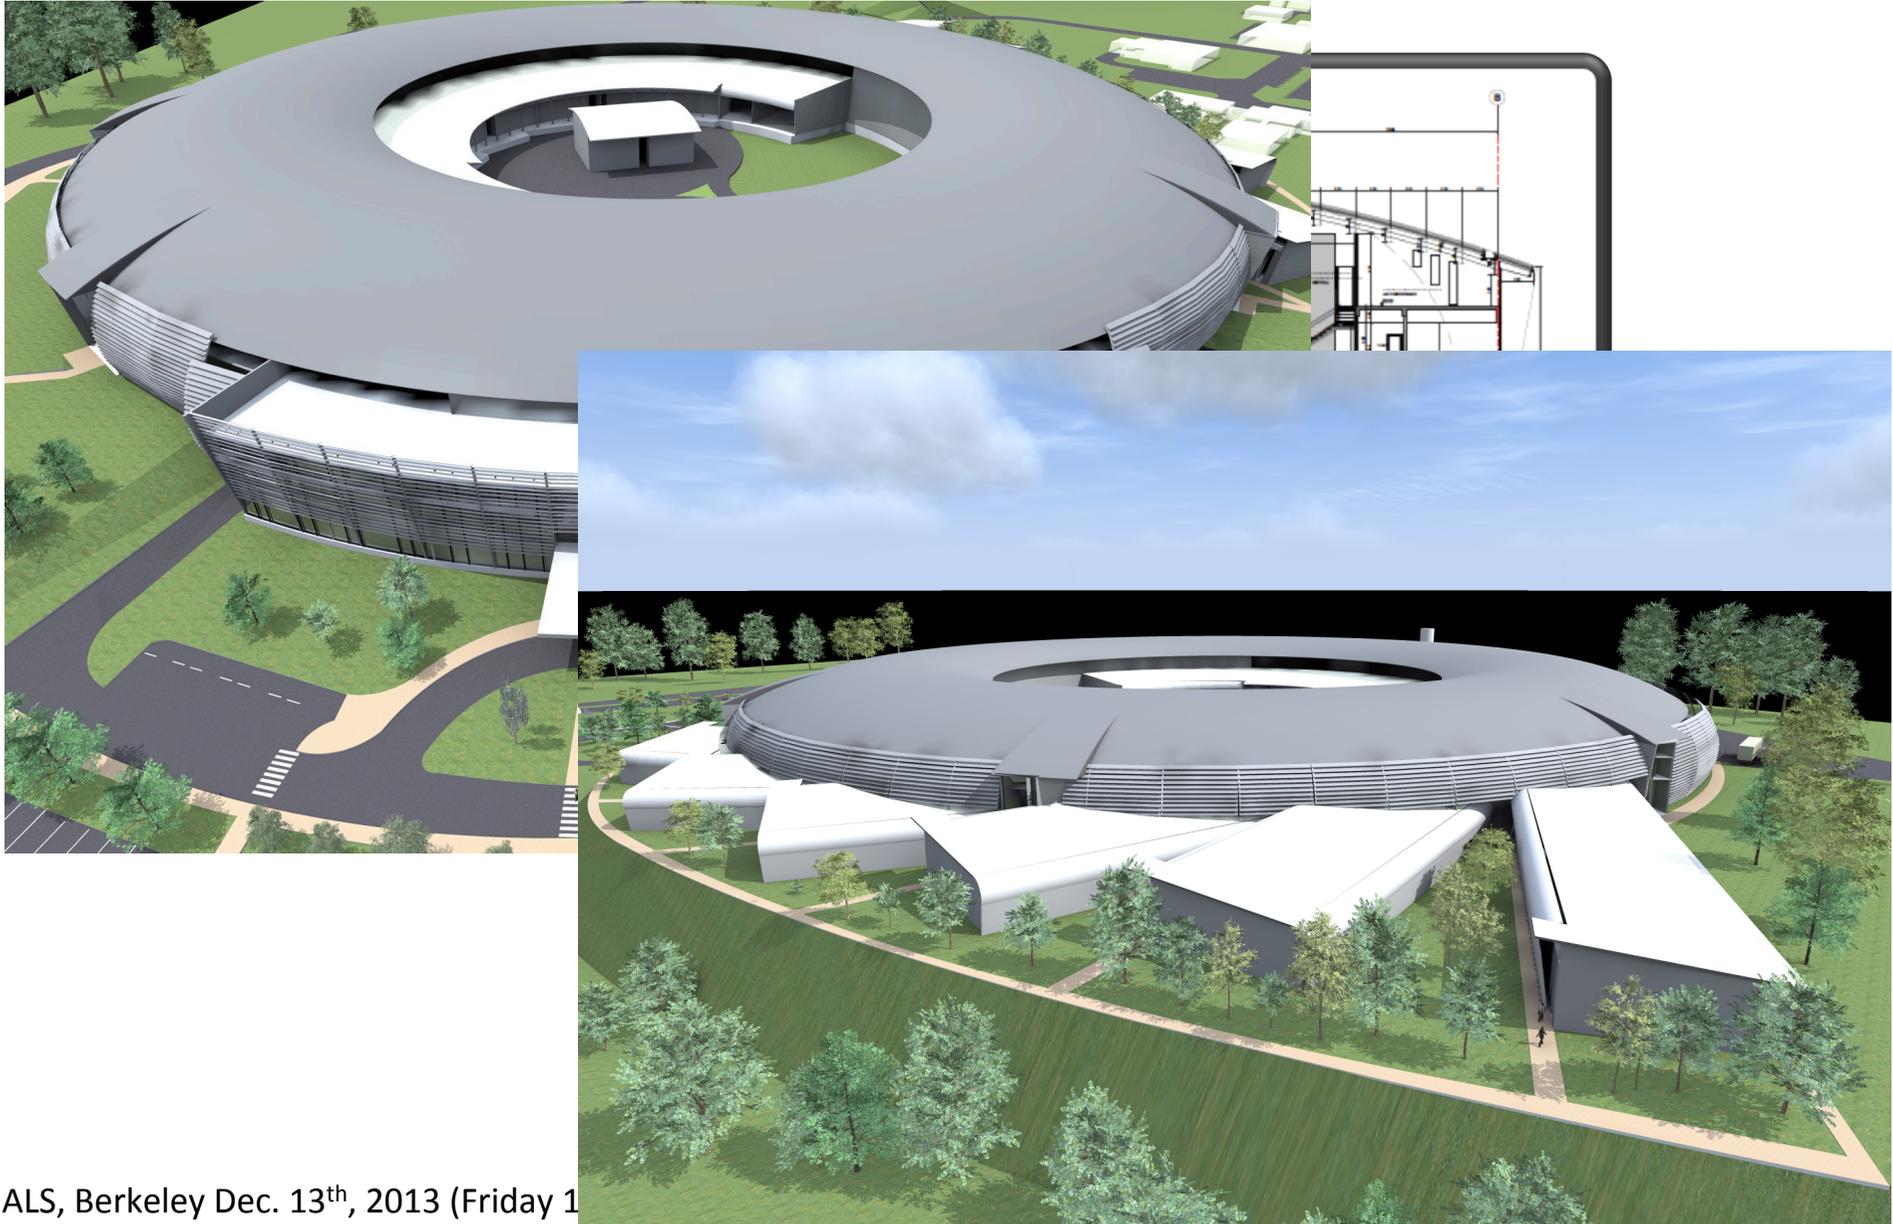

- Schedule

- Sep. 2015 start installations
- Nov. 2016 start SR commissioning

Earth work almost ready

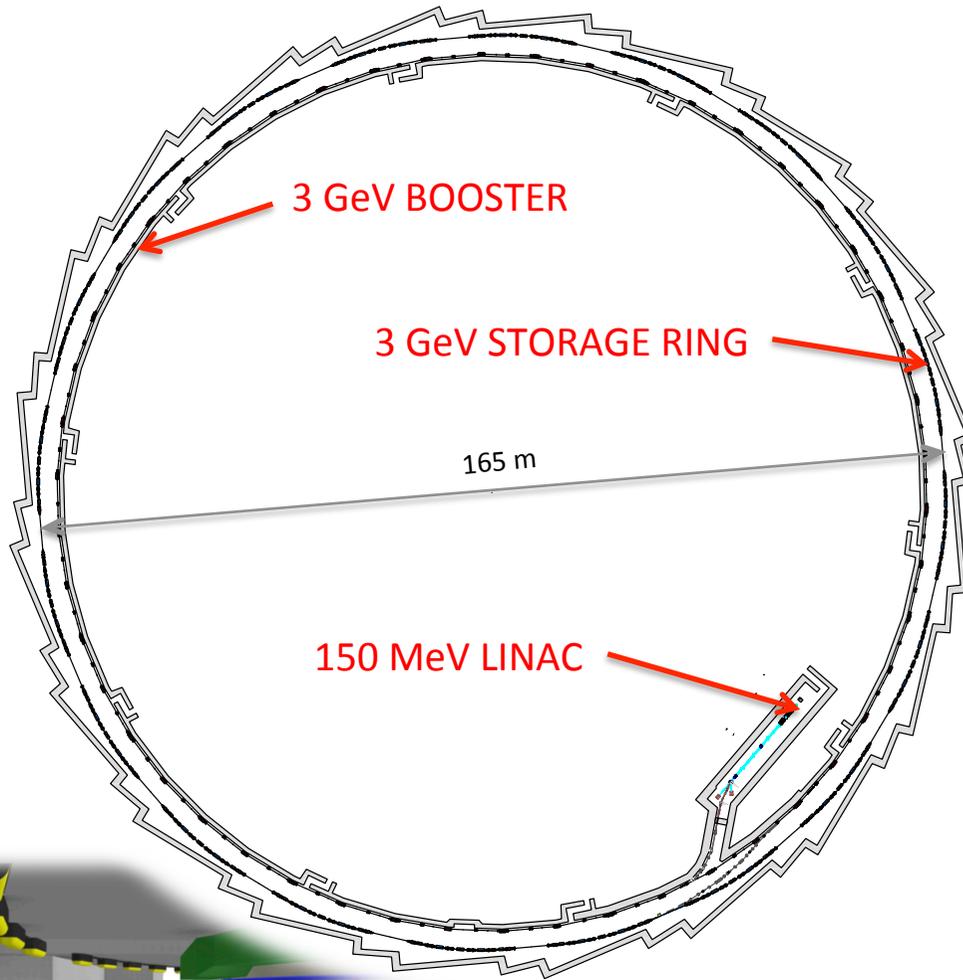

Buildings

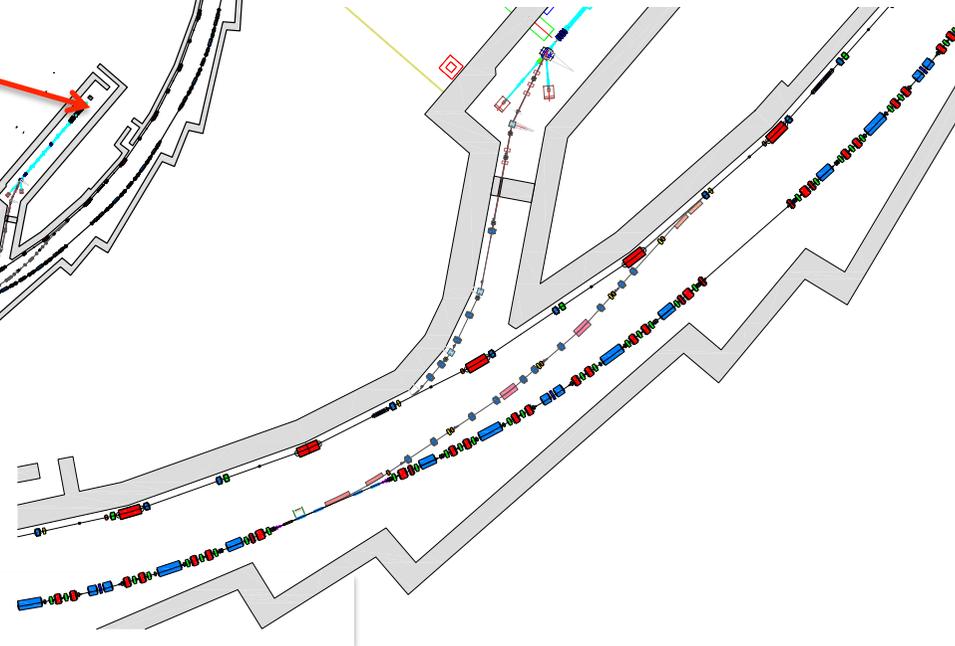

ALS, Berkeley Dec. 13th, 2013 (Friday 1

Accelerators layout

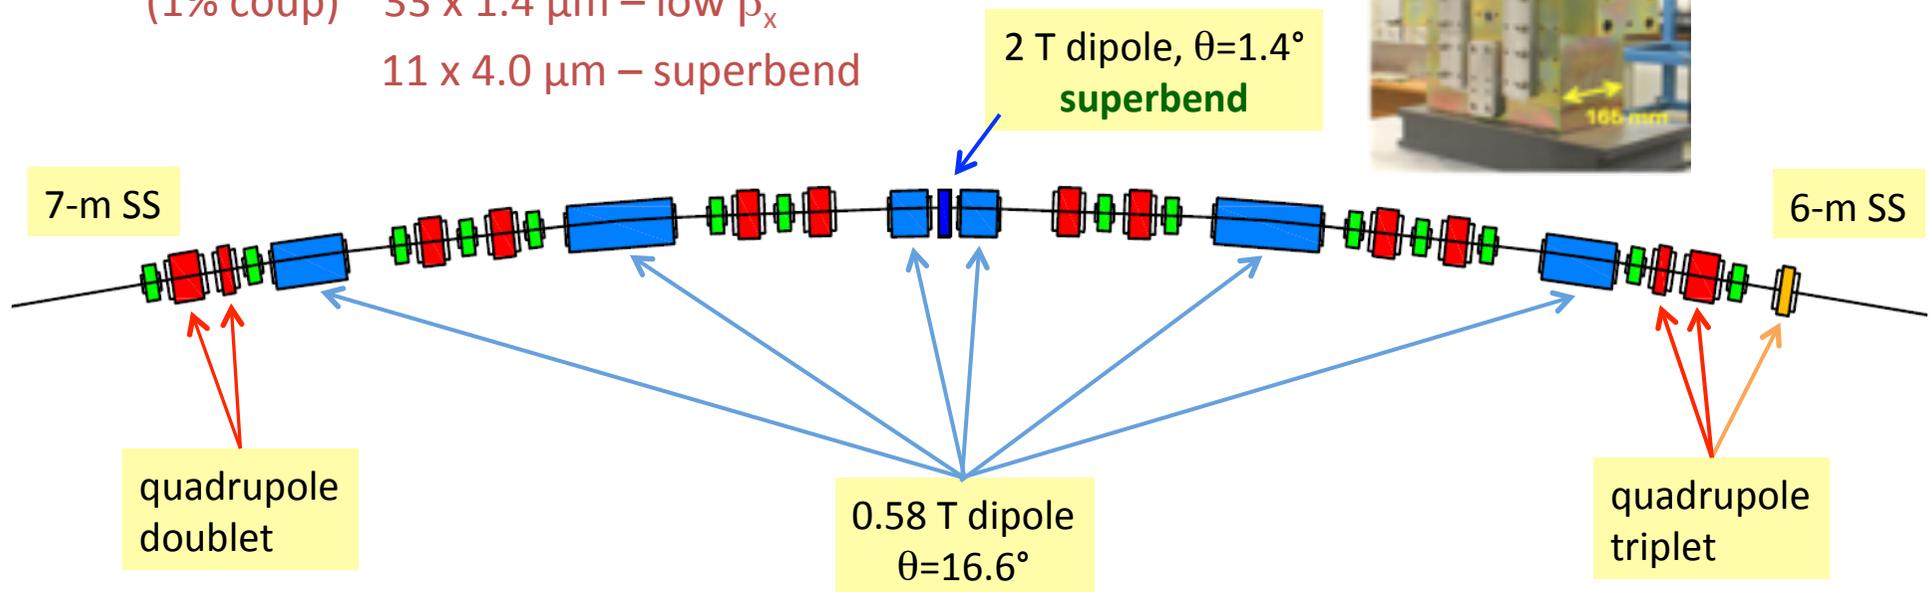

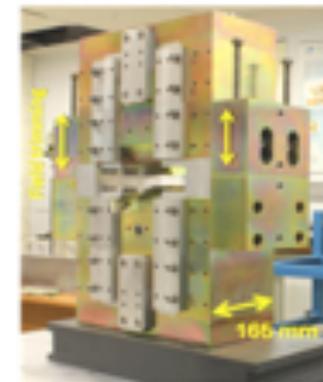

Storage Ring	circumf. (m)	518
	emittance (nm)	0.28
	lattice	20 - 5BA
Booster	circumf. (m)	496
	emittance (nm)	3.7
	lattice	50 fodo

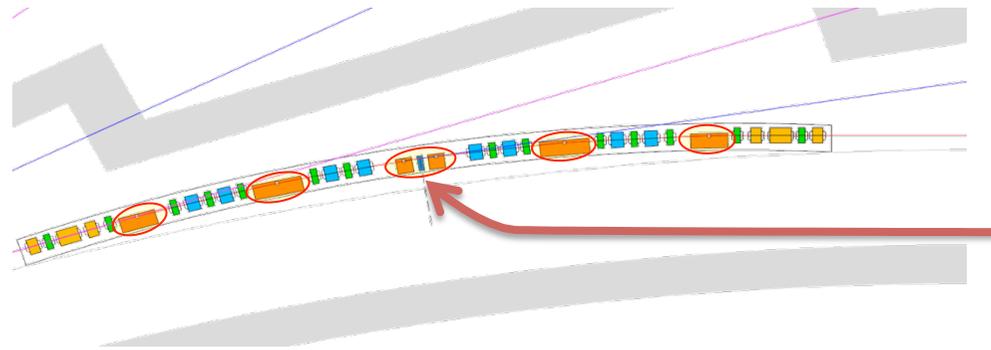

Sirius main parameters

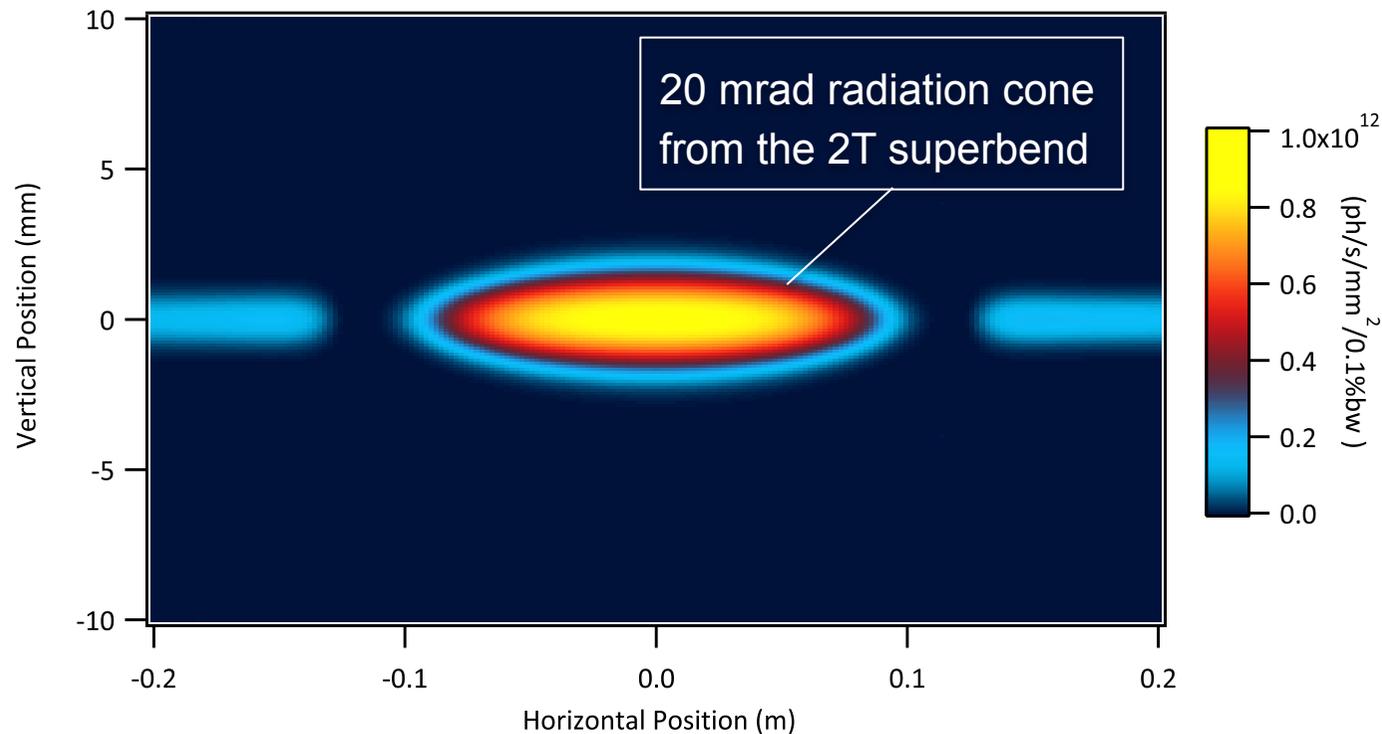

- Energy: 3 GeV
- Circunference: 518 m
- Emittance without wigglers: 0.28 nm.rad
- Lattice: 5BA with low field main dipoles (0.58 T) and split central dipole to accommodate a 2 T superbend
- Straight sections: 10 x 7m – high β_x
10 x 6m – low β_x
- Beam size: 68 x 3.0 μm – high β_x
(1% coup) 33 x 1.4 μm – low β_x
11 x 4.0 μm – superbend

Superbends: hard X-ray source

- 2T permanent magnet superbend
- 12 keV critical energy
- 1.4° deflection
- X-rays produced only at beamline exit
- Modest total energy loss

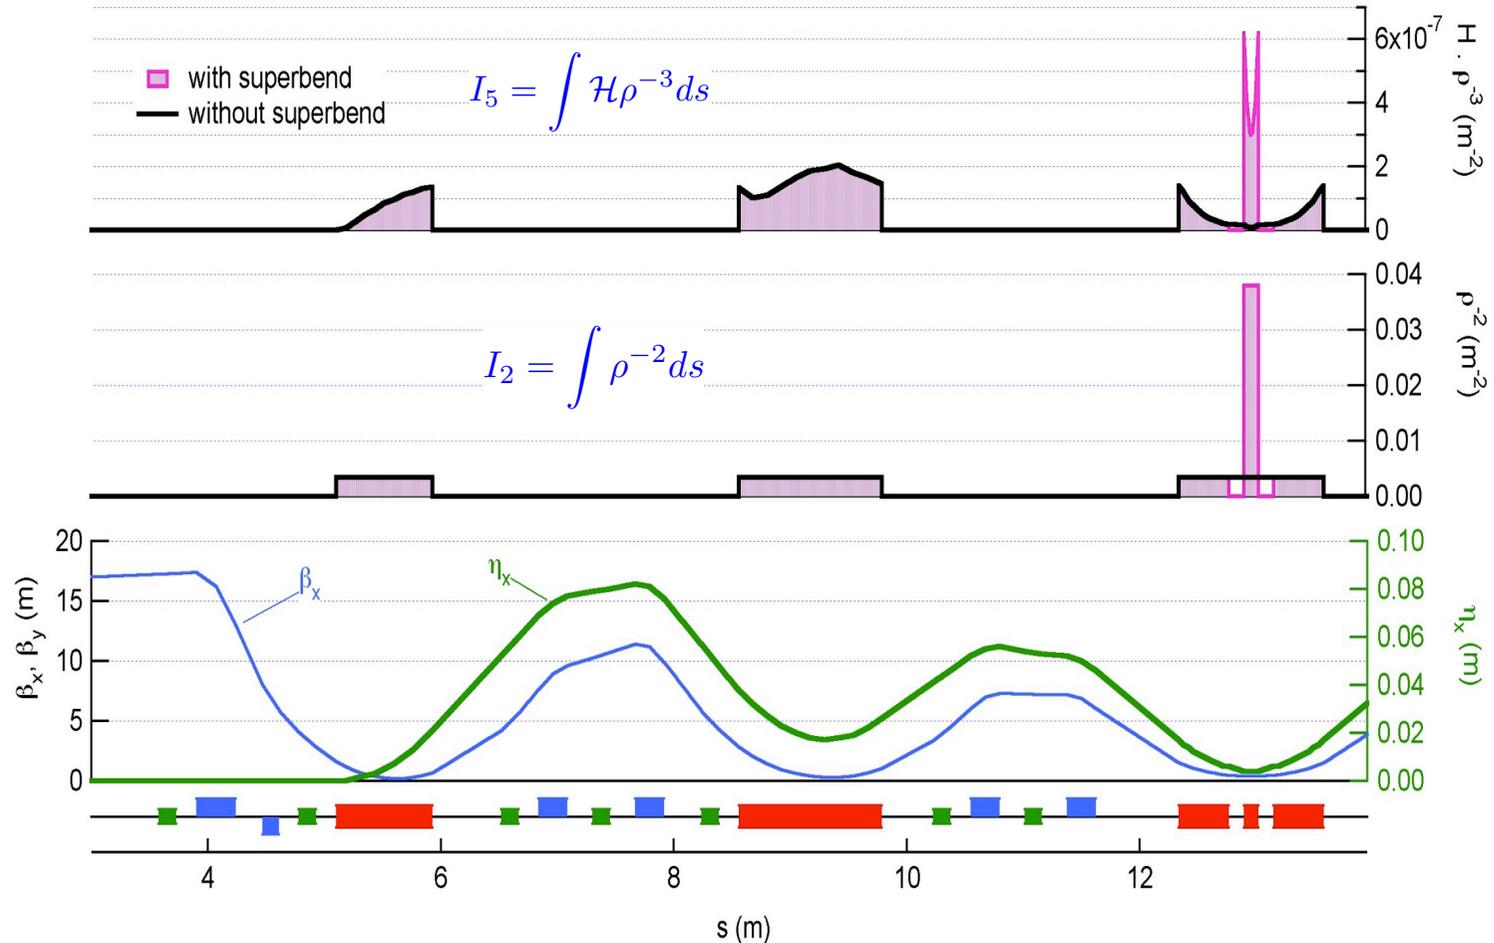

Flux density ($\text{ph/s}/0.1\%bw/\text{mm}^2$) of 12 keV photons from the 2T superbend at 10 m from the source, calculated with SRW (Chubar & Elleaume)

Superbends: longitudinal gradient

$$\mathcal{H} = \gamma_x D^2 + 2\alpha_x DD' + \beta_x D'^2$$

$$\epsilon \propto \frac{I_5}{I_2}$$

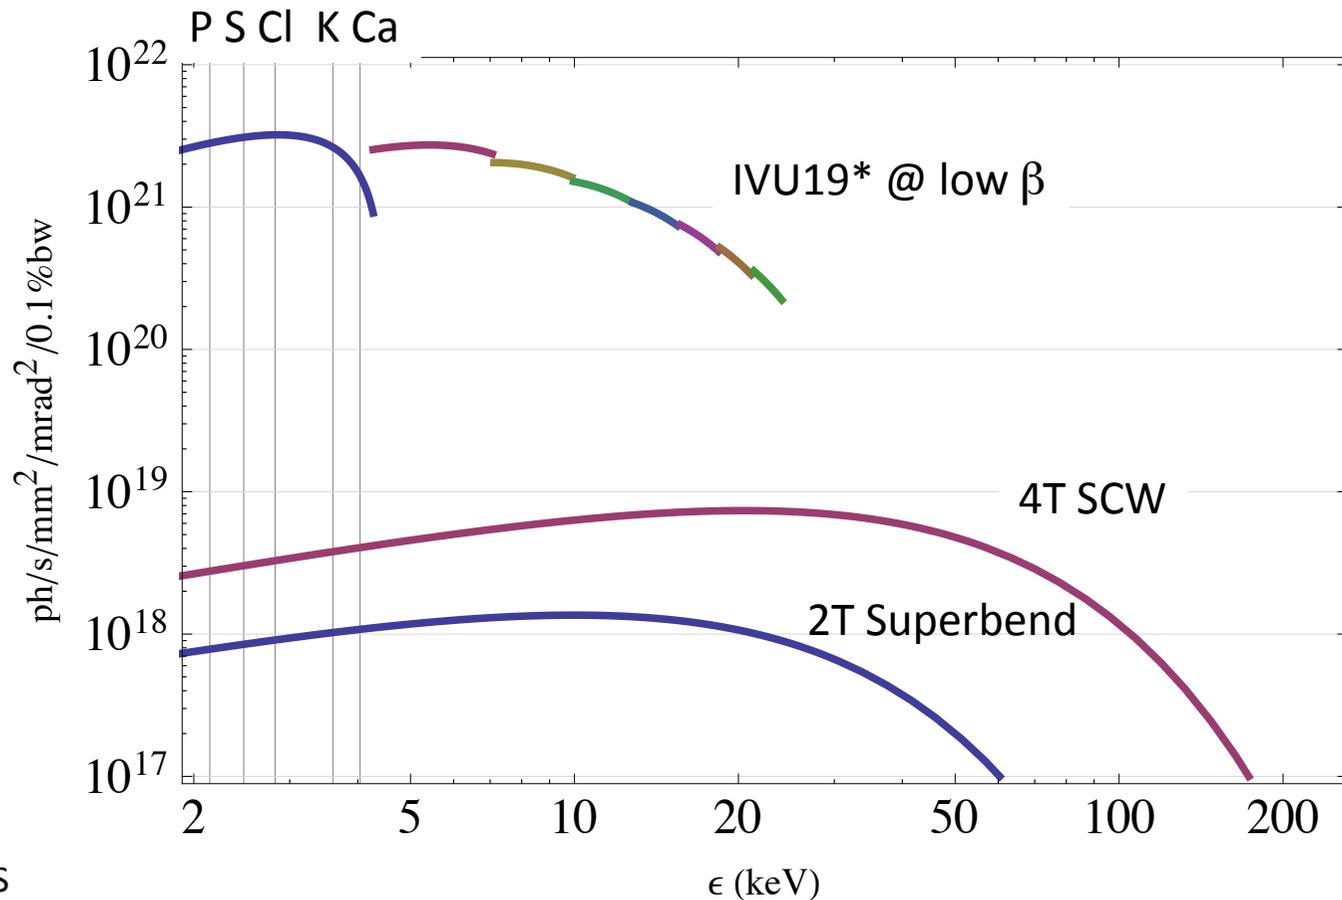

- without superbends: $\epsilon = 0.31$ nm.rad
 - with superbends: $\epsilon = 0.28$ nm.rad 10% reduction

X-ray brilliance (on axis)

- Phosphor: *Soil sciences, Agriculture, Mineralogy, Catalysis*
 - Sulfur: *Petroleomics, Corrosion in pre-salt environment, Sulfur MAD/SAD*
 - Chlorine: *Corrosion in sea and pre-salt environment*
 - Potassium: *Alkali metal promoter, promoter of FT catalysis*
 - Calcium: *Bio-minerals, Nutrition, Nano-fossils*

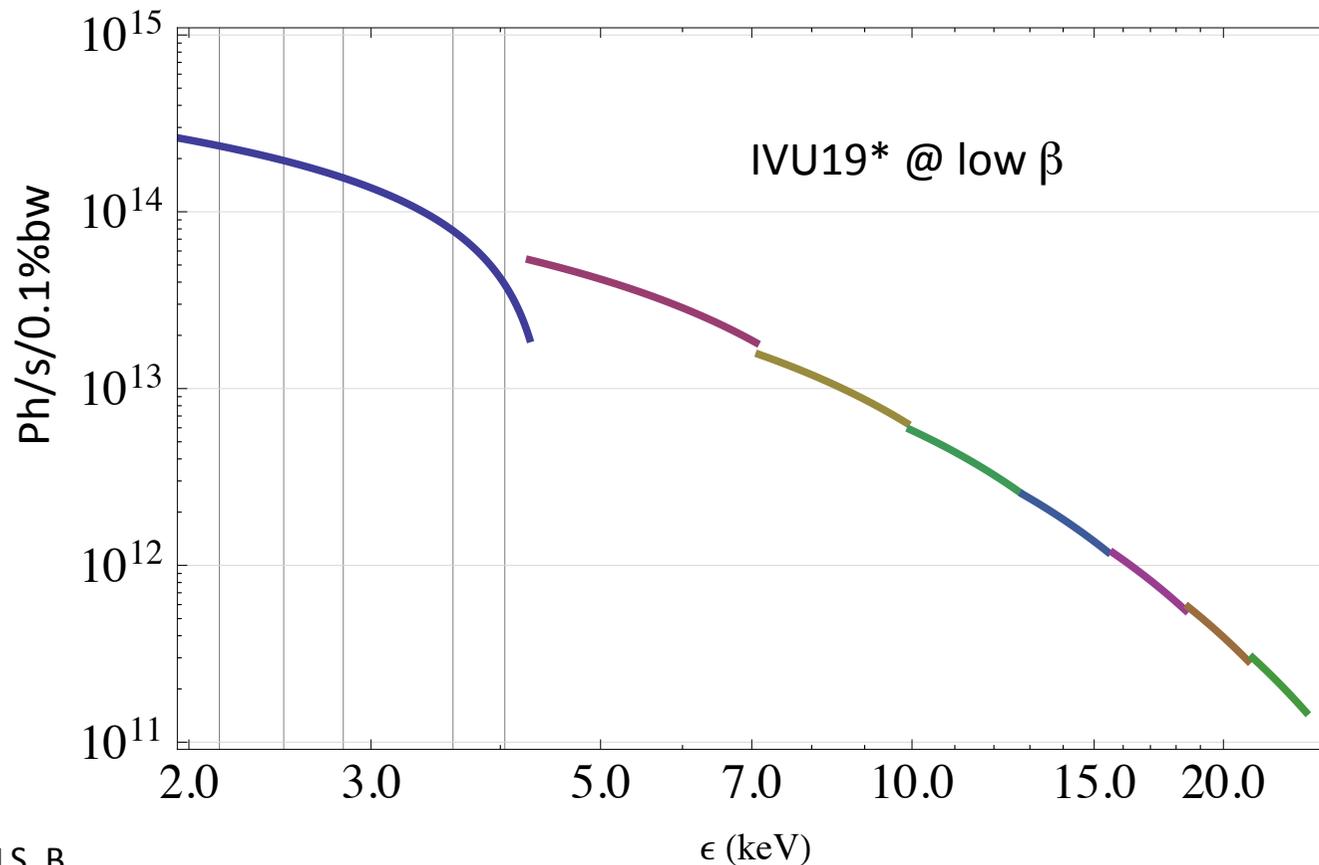

*(NdFeB, Br = 1.3 T, min. gap 5 mm, P. Elleaume (2000) fit to Halbach)

Coherent X-ray flux

- Low energy XPCS and CDI for biological samples
 - *Above 2 keV sample damage is practically constant*
- High Coherent flux up to 25 keV
 - *Crucial for all diffraction limited focusing*

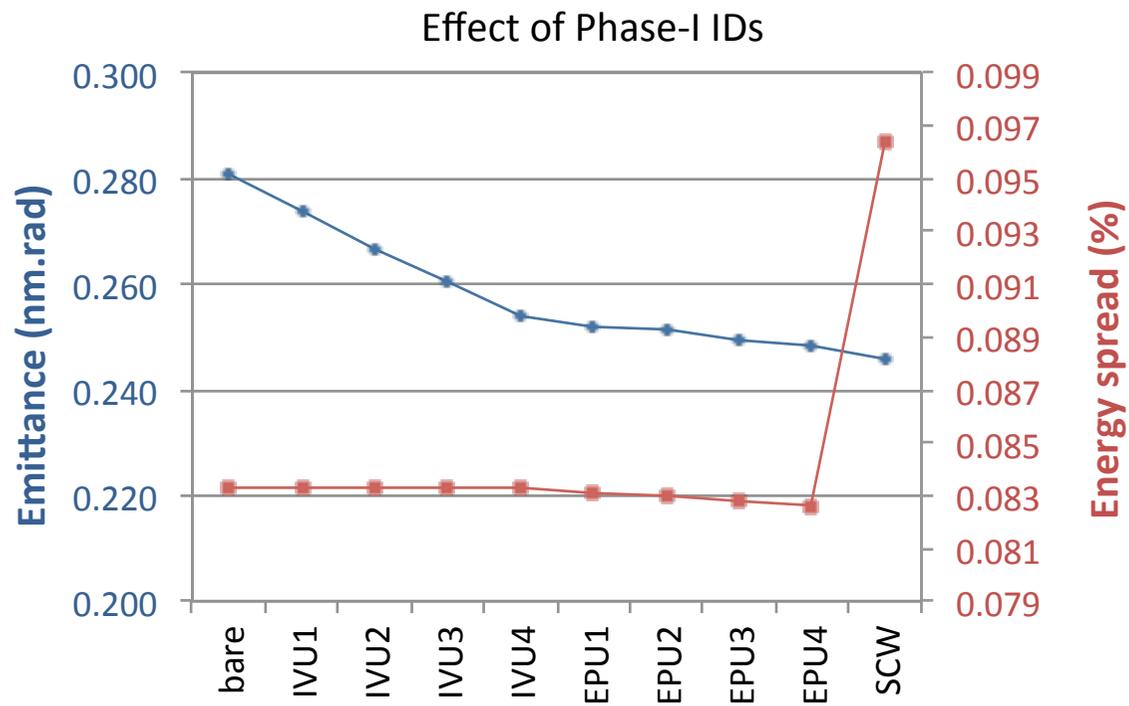

*(NdFeB, Br = 1.3 T,
min. gap 5 mm,
P. Elleaume (2000)
fit to Halbach)

Emittance optimization

- **Other tricks to reduce emittance for given Energy and Number of Dipoles**
 - Dipoles with transverse gradient to increase J_x .
 - Achromatic cells \Rightarrow IDs help to reduce the emittance.
 - 2 T superbend \Rightarrow longitudinal field gradient \Rightarrow strong focusing of the H-function at superbend.
 - Shorter outer dipoles. Outer dipoles are not optimized for emittance reduction because of the zero-dispersion condition. In the optimized condition the dispersion is minimum at the dipole center.
 - Low field dipoles \Rightarrow reduced energy spread
 - \Rightarrow Longitudinal emittance reduction.

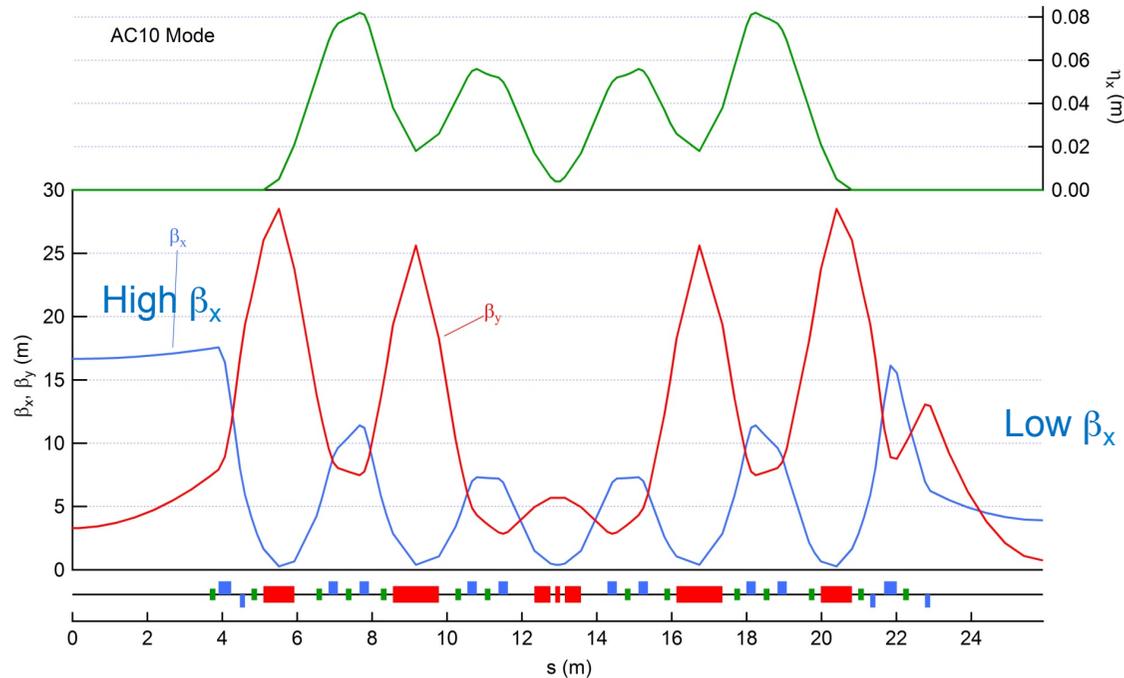

Effect of phase-I IDs

ID	K	λ (mm)	L (m)	B (T)
IVU1	2.07	18	2	1.2
IVU2	2.07	18	2	1.2
IVU3	2.07	8	2	1.2
IVU4	2.07	18	2	1.2
EPU1	3.38	50	3	0.7
EPU2	8	200	3	0.4
EPU3	3.38	50	3	0.7
EPU4	8	200	3	0.4
SCW	22.6	60	3	4.0

Linear optics – AC10 mode

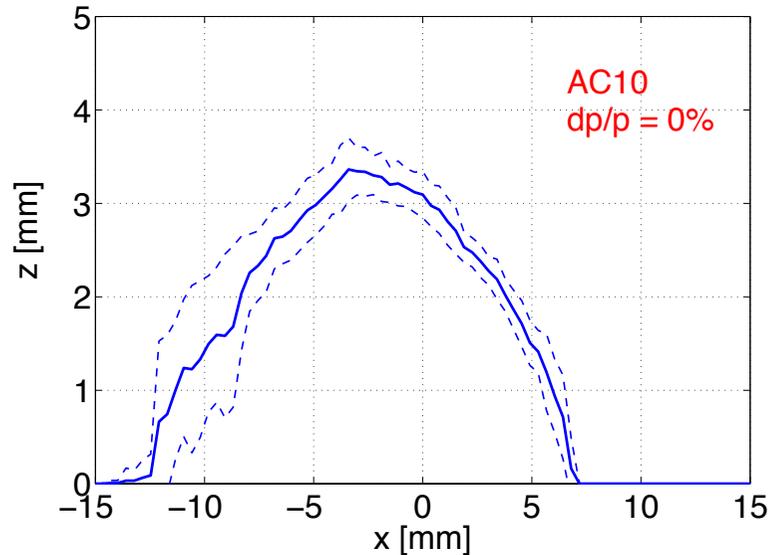

- Alternating high and low β_x
- 8 chromatic quadrupoles (4 families)
- 2 + 3 matching quadrupoles
- 14 sextupoles (9 families)

Nat. emittance	0.28 nm.rad
Tunes ν_x/ν_y	46.2 / 14.15
Nat. chrom. x/y	-113 / -80
Normal. chrom. x/y	-2.4 / -5.7
Mom. comp.	1.7×10^{-4}
Energy spread	0.08 %
Max. quad grad B'	39 T/m
Max. sex grad B''/2	1870 T/m ²
Dipole grad. B'	-7.8 T/m
τ_h	15.9 ms
τ_v	21 ms
τ_s	12.5 ms
J_x	1.32

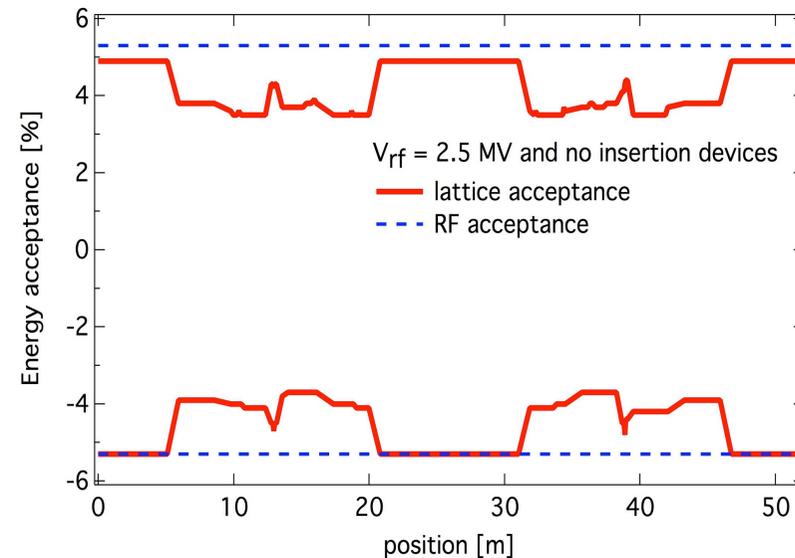

Dynamic aperture and momentum acceptance

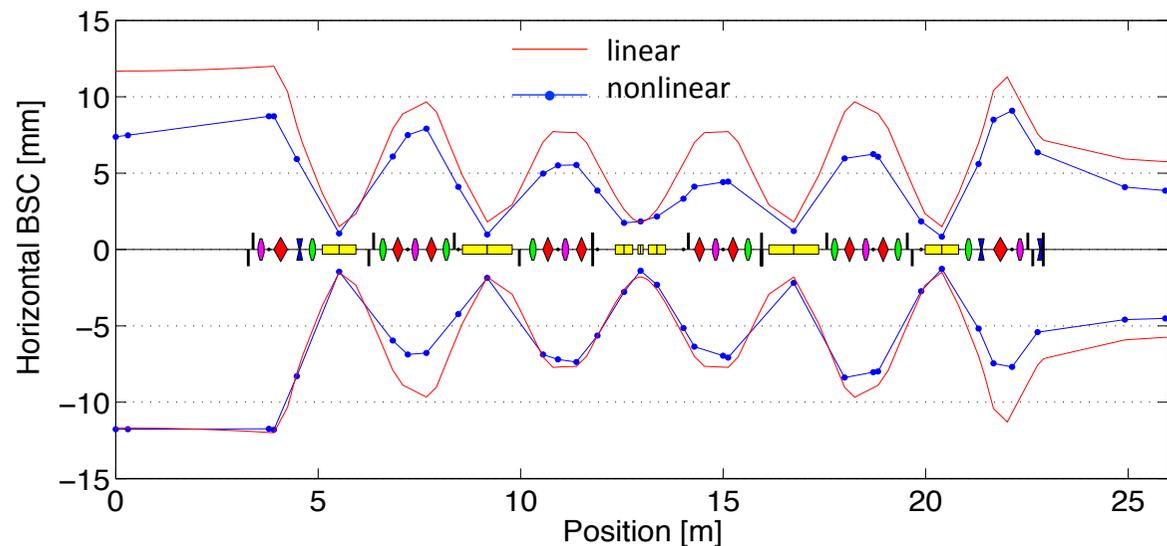

Dynamic aperture

Momentum acceptance

Note asymmetry due to optimization of negative side of DA. Asymmetric beam-stay-clear allows for installation of small absorbers to shadow BPMs and bellows from radiation in straight sections.

DA optimization

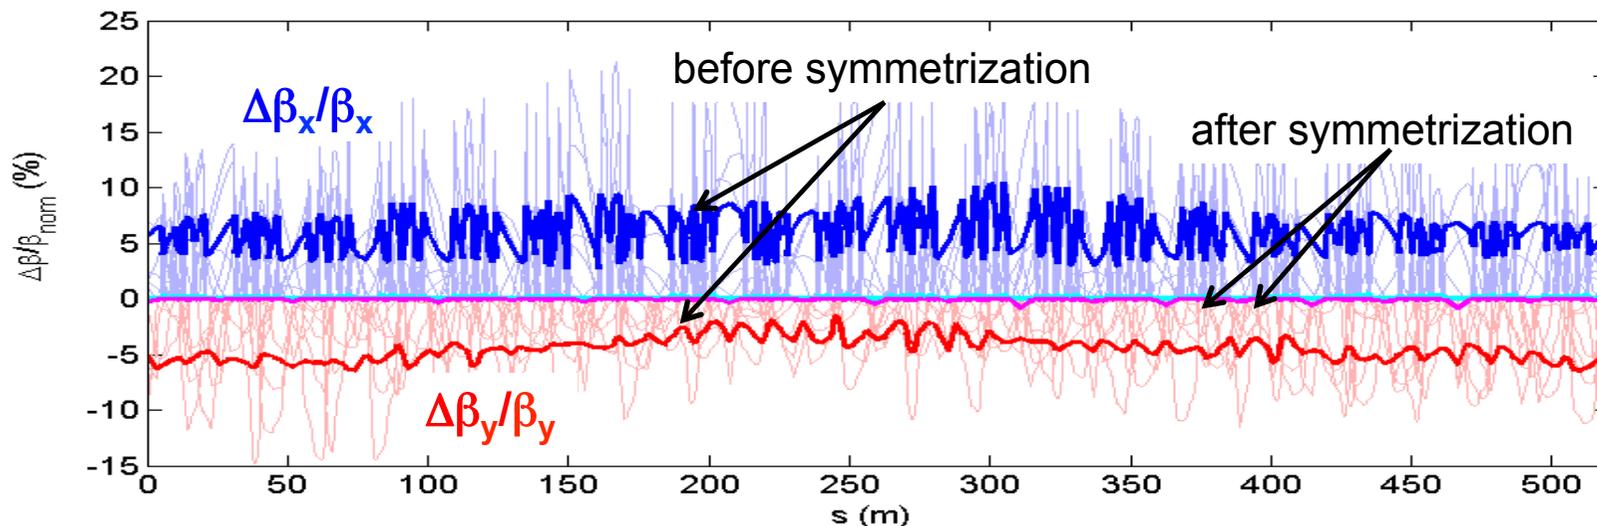

- Optimization using codes: MAD, OPA, Elegant (MOGA), Tracy3 (tracking).
- Alignment errors dominate DA reduction. Optics is affected by off-centered orbit in sextupoles.
- DA improves by restoring design optics. Symmetrization and coupling correction.
- Special care with orbit correction at sextupoles. Place BPMs close to strong sextupoles.

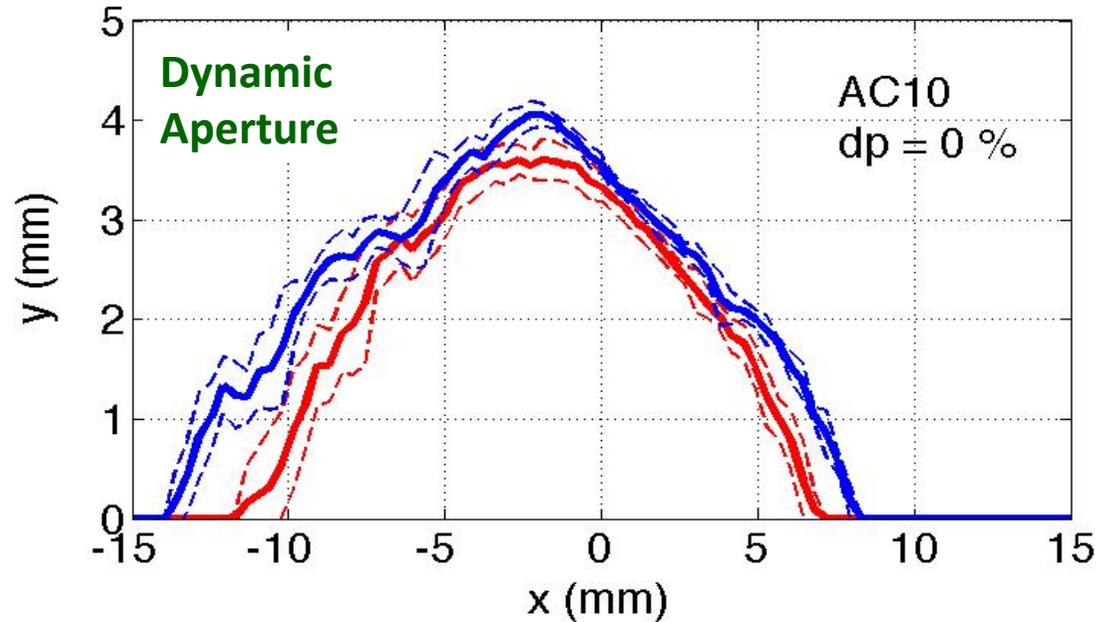

Alignment error*	30	μm
Roll angle error*	0.2	mrad
Excitation error*	0.05	%
Max. rms uncorrected COD (H/V)**	1.9 / 4.4	mm
Max. rms corrected COD (H/V)	21 / 29	μm

*Gaussian distribution of random errors for all magnets truncated at 1σ .

** With sextupoles off.

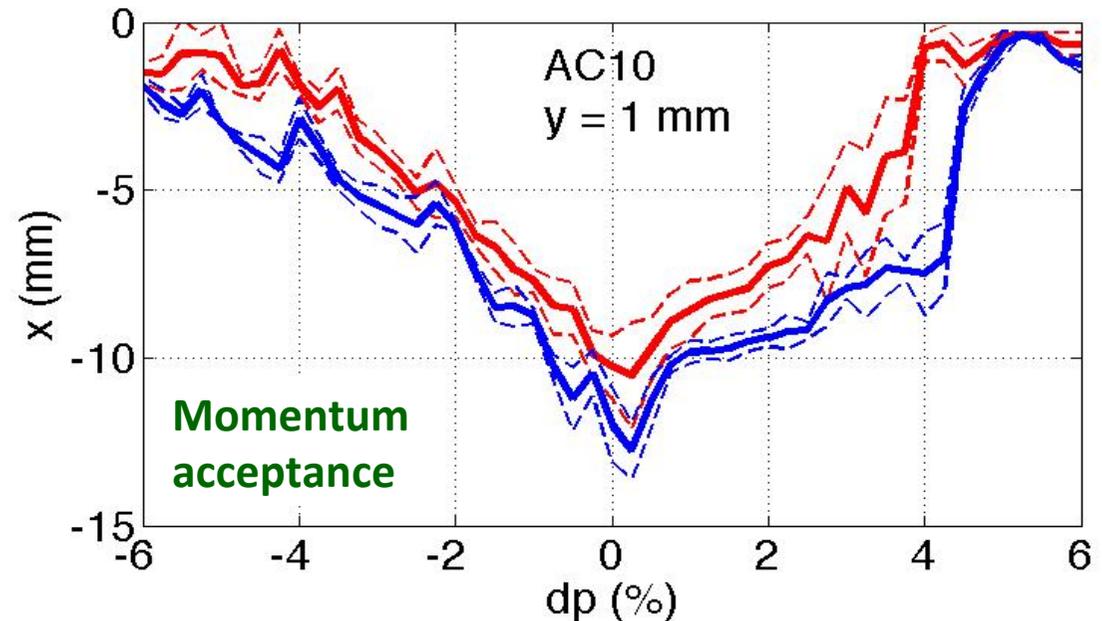

DA with errors and orbit correction

Old version

- without symmetrization
- after symmetrization

- Mode AC10
- DA at center of 7m SS
- Tracking for 5000 turns

Beam Lifetime Scenarios

	Commis.	Phase 1	Phase 2
# of RF cavities (DAMPY)	3	3	6
3 rd harmonic cavity	-	-	yes
RF voltage (MV)	1.8	1.8	2.7
En. loss/turn from IDs (keV)	-	200	350
IDs	-	4 IVU (g=4mm) 4 EPU 1 SCW	8 IVU (g=4mm) 8 EPU 1 SCW
Total current (mA)	100	100	500
Single bunch current (mA)	-	-	2

Lifetime

Calculations include IBS, bunch lengthening by 3rd harmonic cavity, effect of IDs on beam emittance.

Comissioning

- $T_{\text{elastic}} = 66.8 \text{ h}$
 - $T_{\text{inelastic}} = 46.9 \text{ h}$
 - $T_{\text{touschek}} = 19 \text{ h}$
- **$T_{\text{total}} = 11.2 \text{ h @ 100 mA}$**

Phase 1

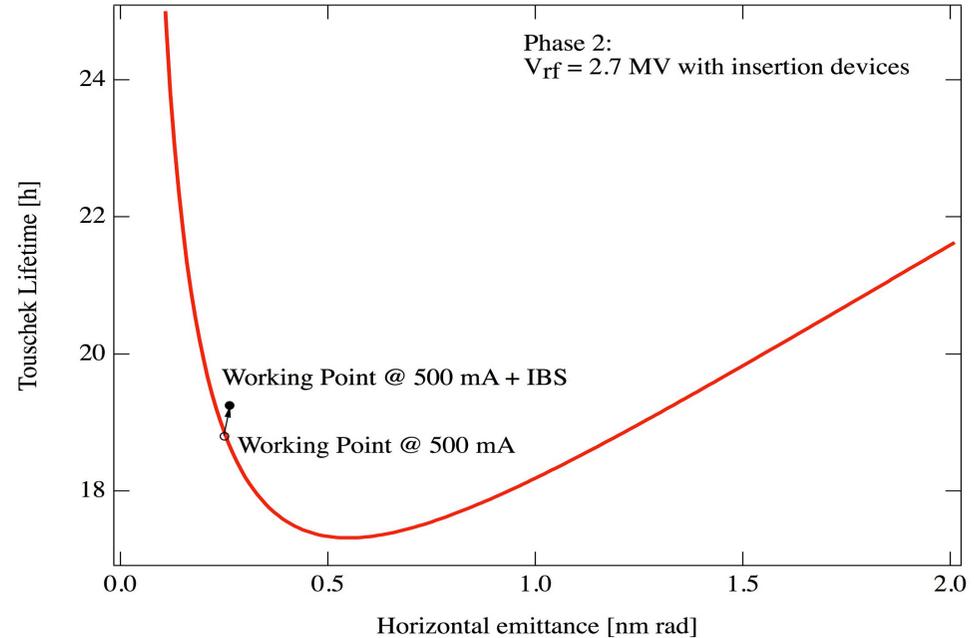

- $T_{\text{elastic}} = 29.7 \text{ h}$
 - $T_{\text{inelastic}} = 45.7 \text{ h}$
 - $T_{\text{touschek}} = 17 \text{ h}$
- **$T_{\text{total}} = 8.7 \text{ h @ 100 mA}$**

Phase 2

- $T_{\text{elastic}} = 29.6 \text{ h}$
 - $T_{\text{inelastic}} = 48.5 \text{ h}$
 - $T_{\text{touschek}} = 19 \text{ h}$
- **$T_{\text{total}} = 9.5 \text{ h @ 500 mA}$**

For single bunch :

- $T_{\text{touschek}} = 5.7 \text{ h}$
- **$T_{\text{total}} = 5.7 \text{ h @ 2 mA}$**

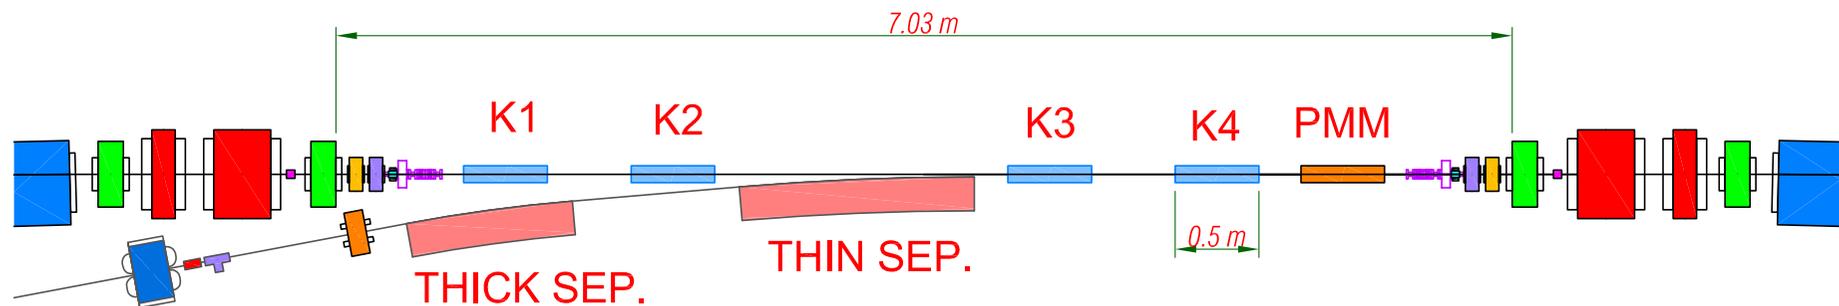

Injection system

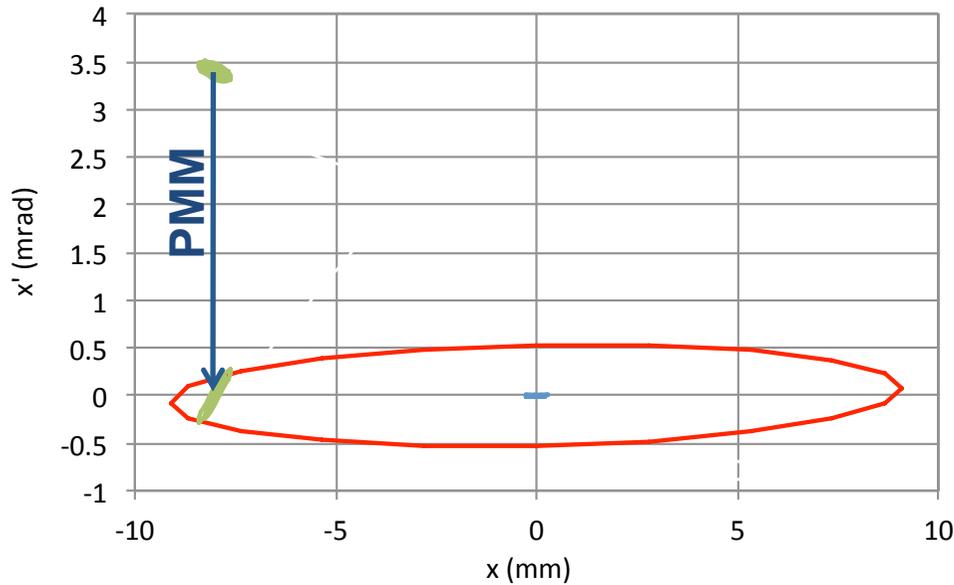

Booster emittance (nm)	3.8
Booster circumference (m)	496.8
Off-axis injection schemes	4 kicker/PMM

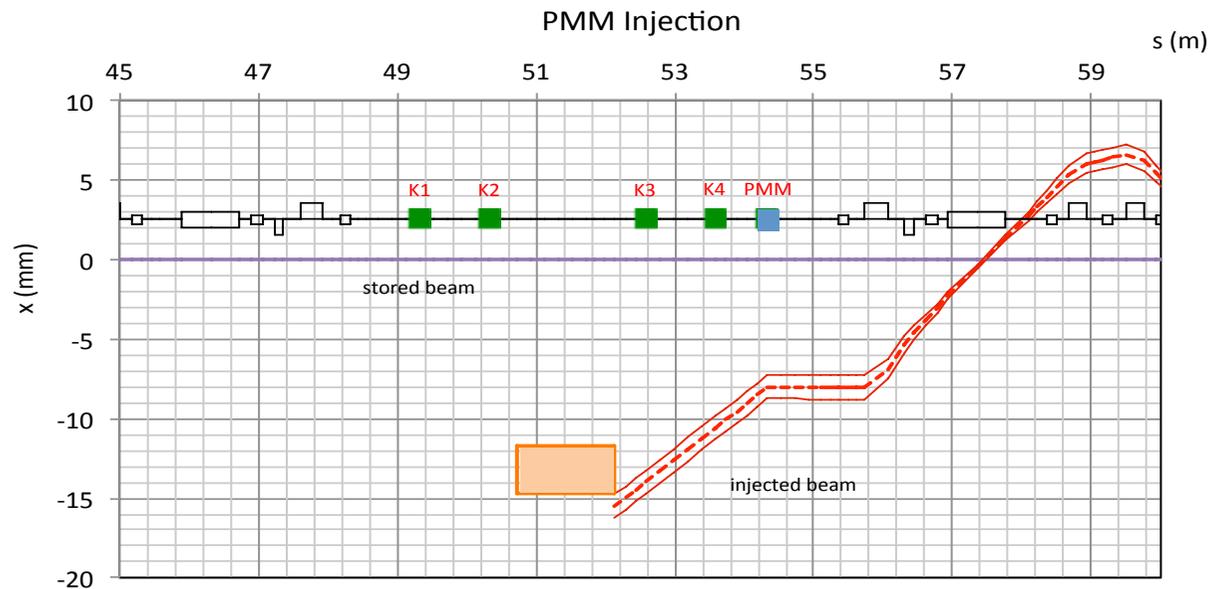

- Use same straight section for 4 kicker and PMM injection

Injection with PMM

PMM deflection @ beam centroid	3.4	mrad
PMM length	0.5	m
PMM magnetic field @ beam centroid	0.068	T
Beam centroid position @ PMM	8	mm
Injected beam angle @ end of septum	3.4	mrad

Injection tests at UVX using a pulsed sextupole

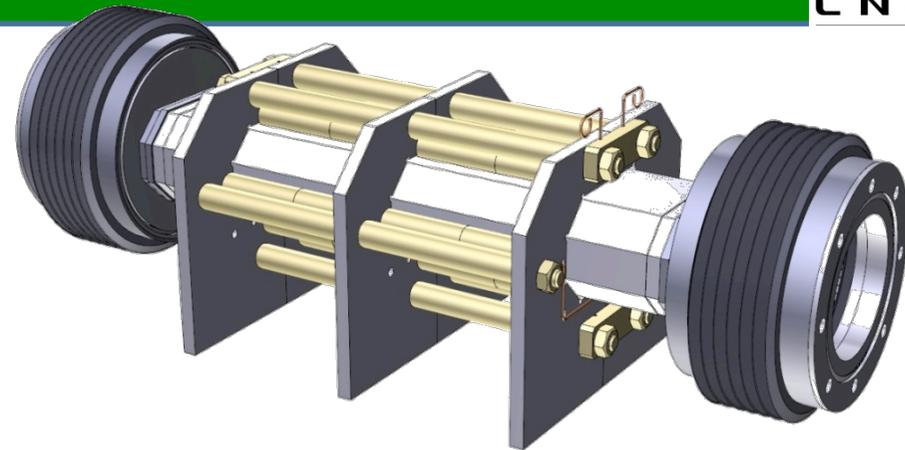

Conventional injection method: 4 kickers to produce a temporary bump in the storage ring orbit to overlap its acceptance with the incoming beam.

Difficult to match the four kicker pulses

→ disturbs the stored beam

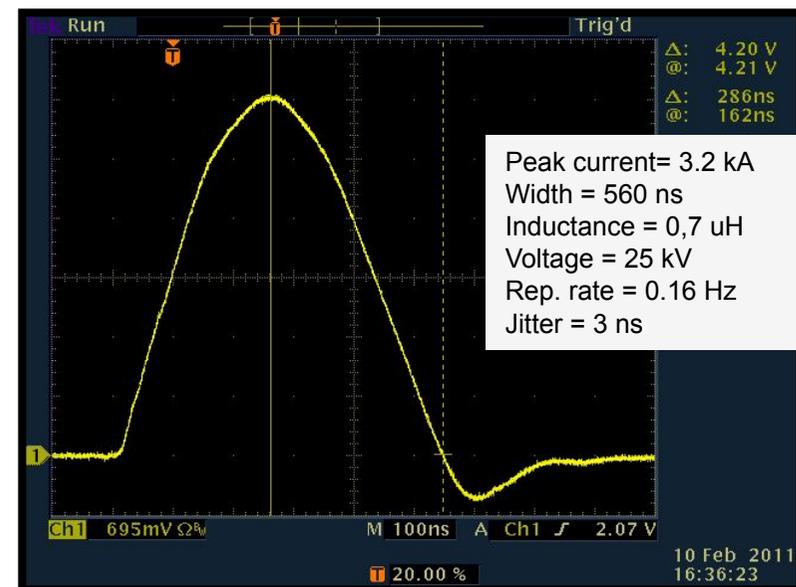

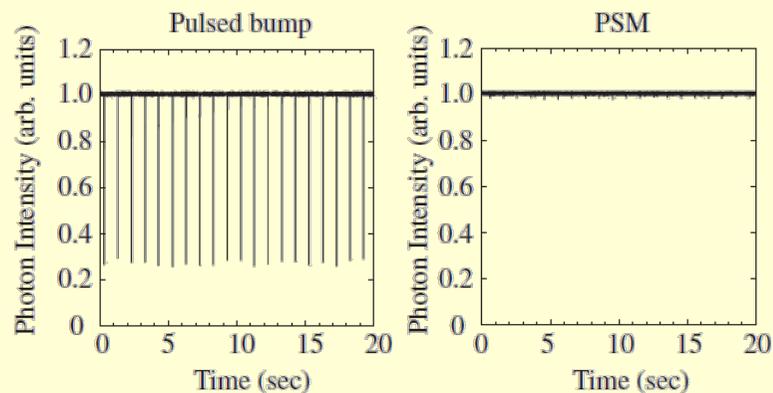

→ bad for top-up mode

Pulsed sextupole method: eliminates the need for a bump in the stored beam. The orbit is not affected.

Pulsed (air core) sextupole to be tested at the existing ring. This magnet will be installed in straight #7 over a ceramic vacuum chamber already installed during the last shutdown.

Photon intensity at BL-14A (*Photon Factory*) in the pulsed bump injection and the PSM injection. The spike train is synchronized with the beam injection. The sampling rate of the signals was 10 kHz.

Phase 1 beamlines

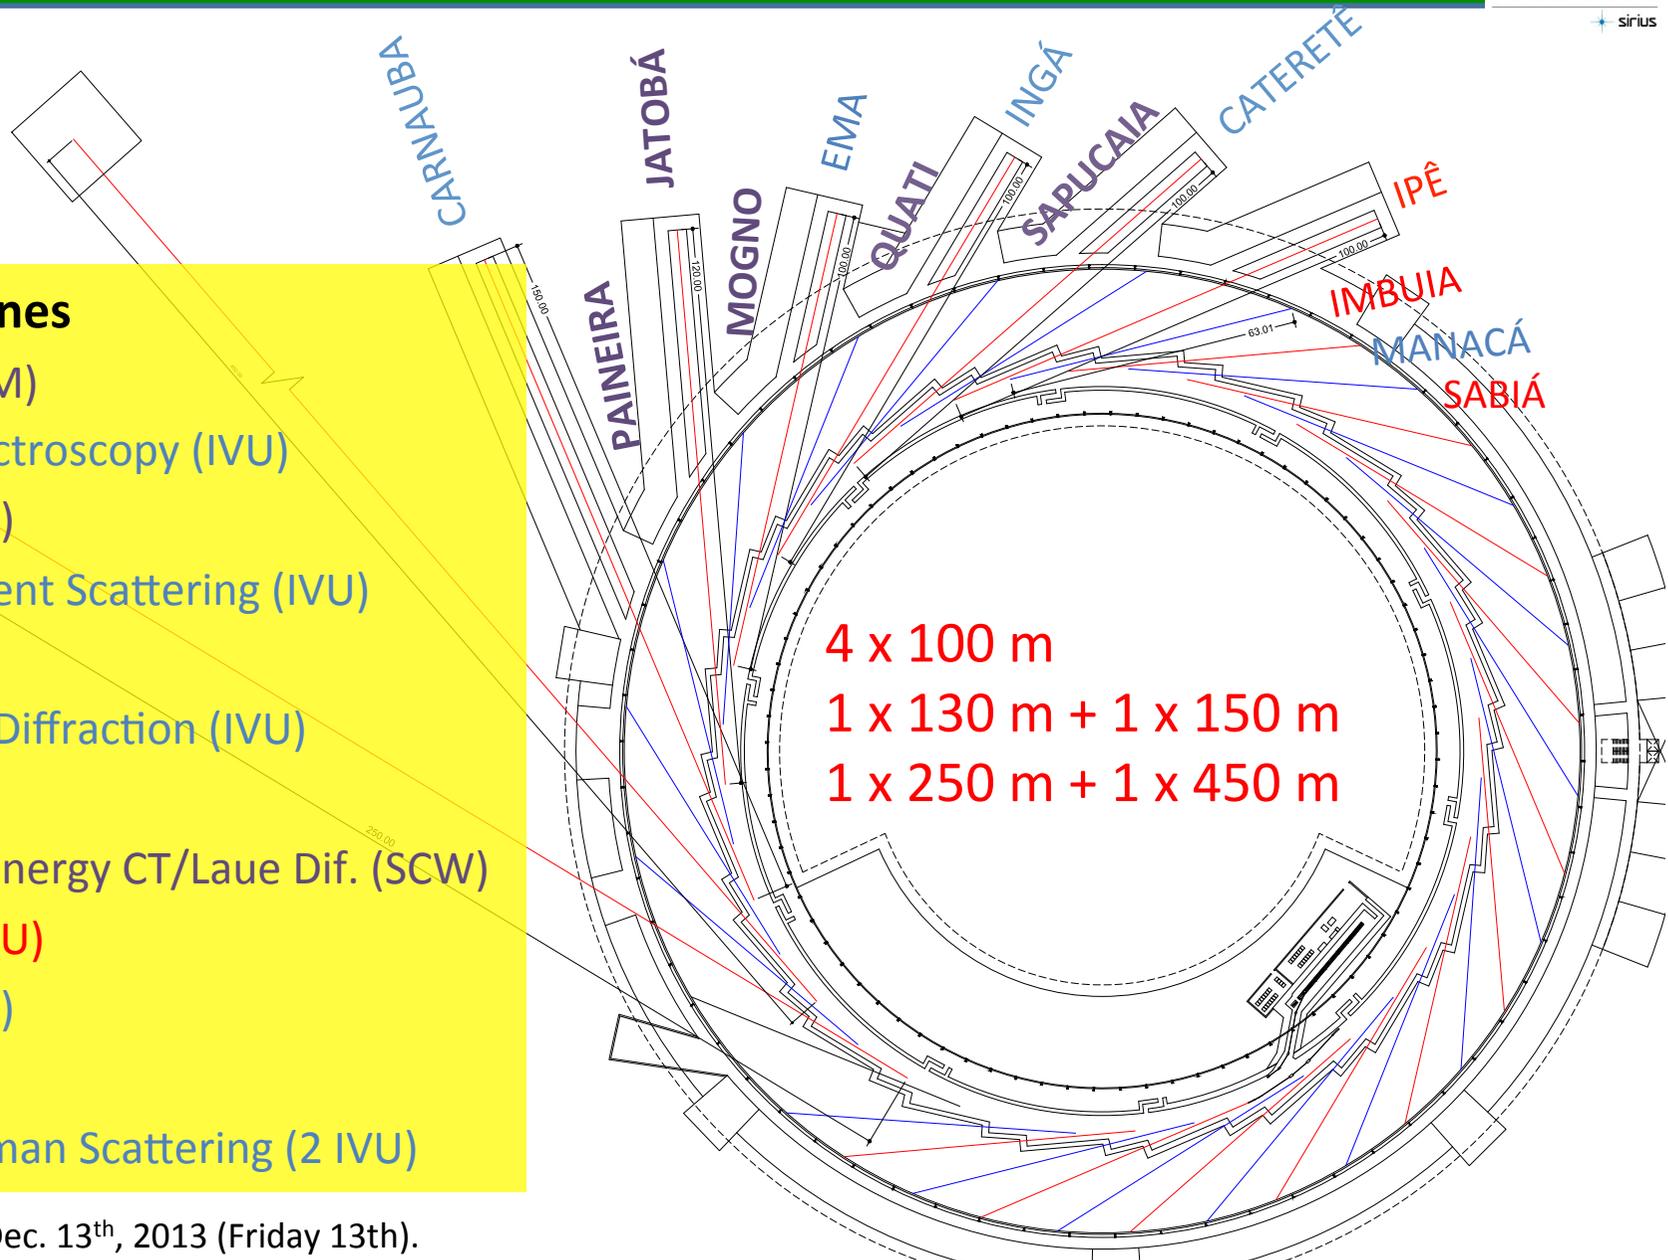

- Provide some of the *state of the art* techniques that explore coherence, micro and nano-focusing and high energies
 - New science!
- Cover all conventional techniques (SAXS/XPD/EXAFS/ μ CT...) existing today at LNLS with the 2T superbends
 - Upgrade the current research activities of the user community
- 2 undulator based PGMs (high resolution and high flux)
 - keep up the good momentum from the UVX

Phase 1 beamlines

13 Beamlines

- 1 EXAFS (BM)
 - + 1 μ -Spectroscopy (IVU)
- 1 SAXS (BM)
 - + 1 coherent Scattering (IVU)
- 1 XPD (BM)
 - + 1 nano-Diffraction (IVU)

PM dipoles

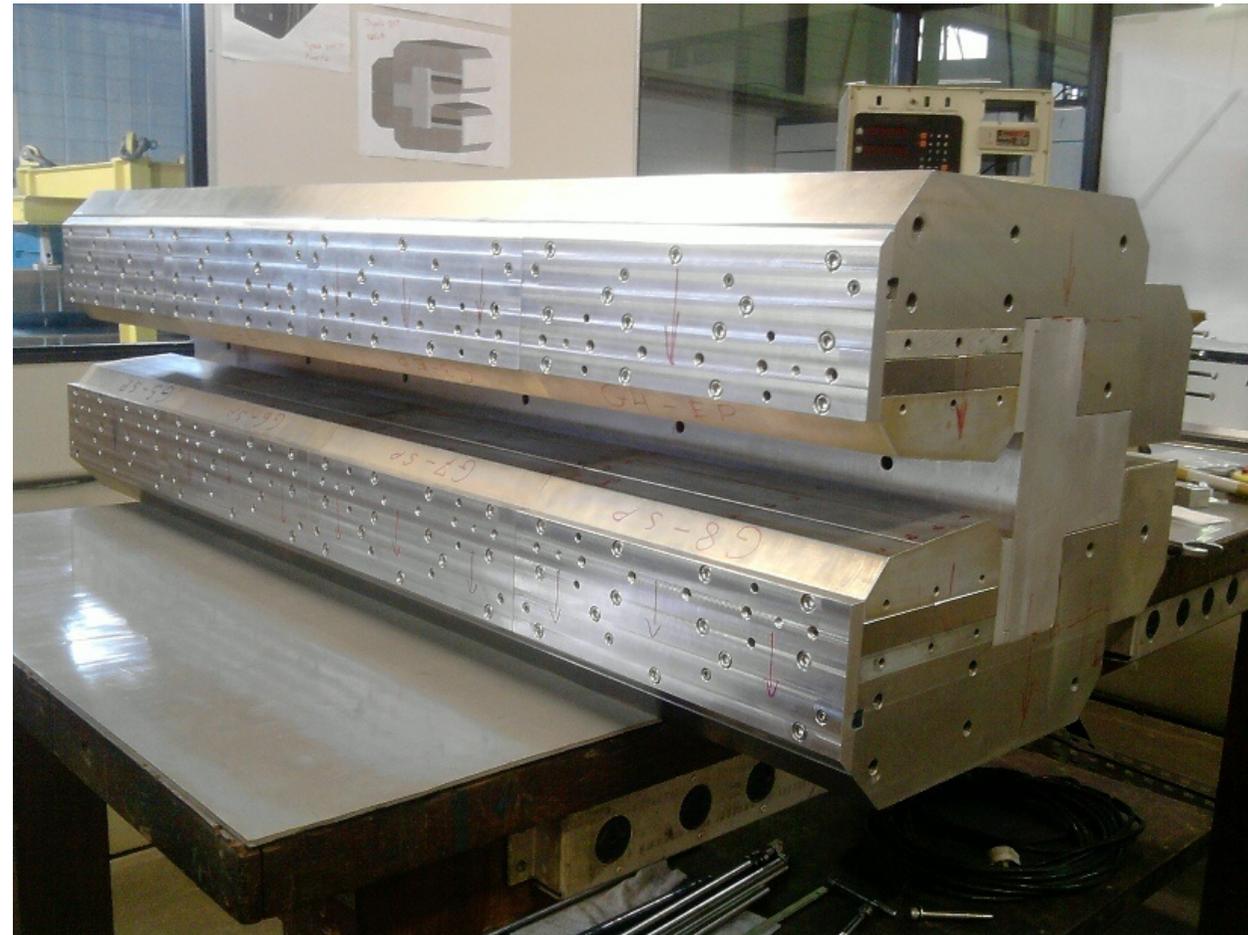

Prototype II - NdFeB

$B_0 = 0.5 \text{ T}$

$G = 2 \text{ T/m}$

$\theta = 3.5^\circ \text{ and } 5^\circ$

$B = 2.0 \text{ T}$

ALS, Berkeley Dec. 13th, 2013 (Friday 13th).

Conventional Magnets Production

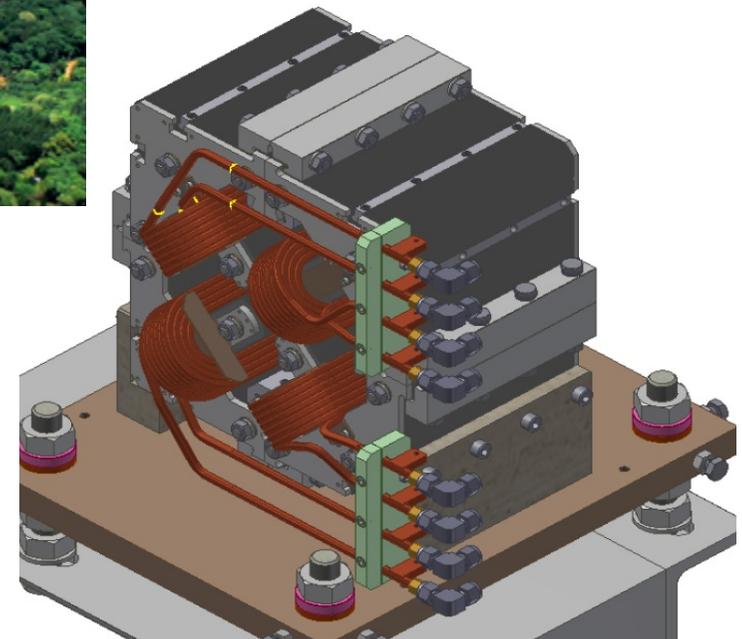

WEG

Brazilian electrical
motor manufacturer
with 26000 employees

First 50 units of the
booster quadrupoles
will arrive next July

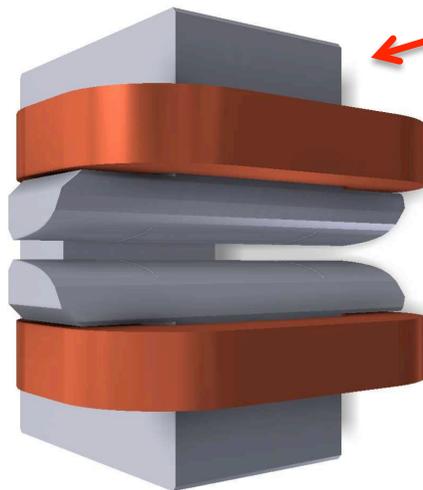

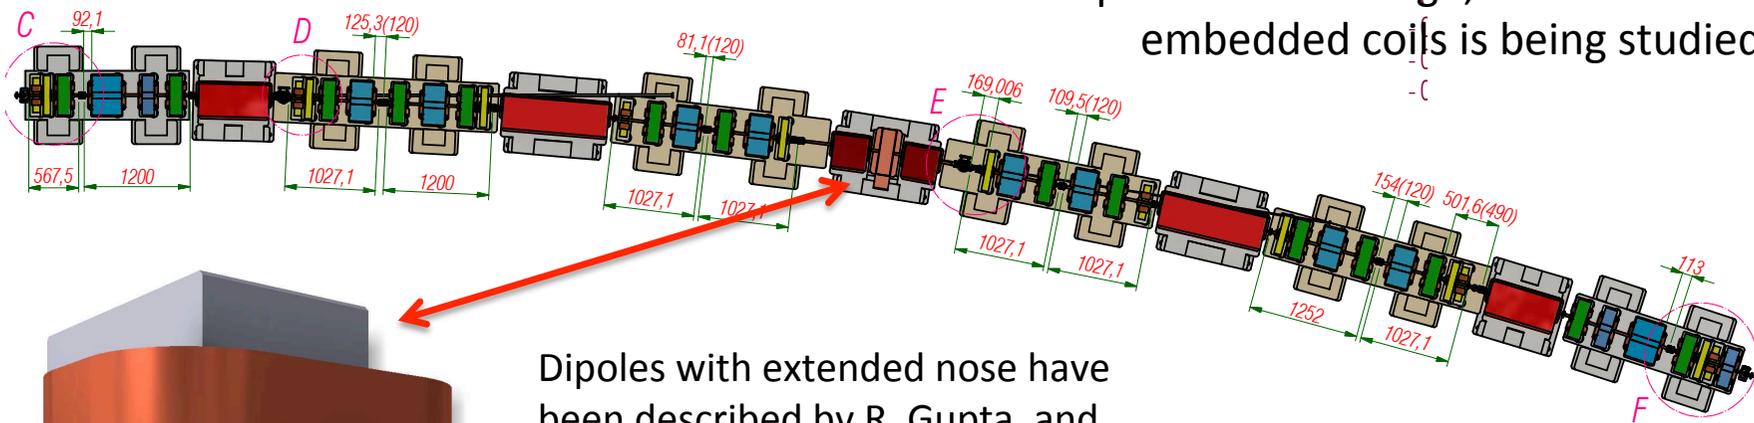

ALS, Berkeley Dec. 13th, 2013 (Friday 13th).

Very compact magnet lattice

The initial design for Sirius proposed permanent magnets (PM) – NdFeB – for all dipoles. Later this idea was abandoned and only the high field slice is kept with PM. This created a problem because of the extra space needed for coils.

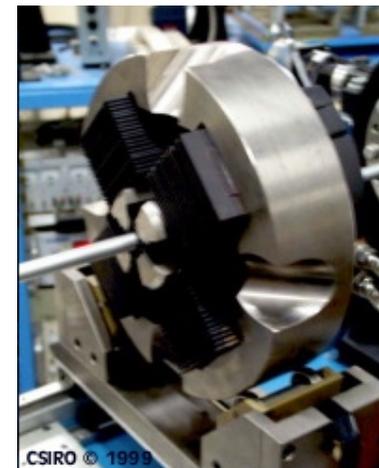

To keep the lattice design, a solution with embedded coils is being studied.

Simulation of electromagnetic dipole with embedded coils

Dipoles with extended nose have been described by R. Gupta, and fabricated at BNL.

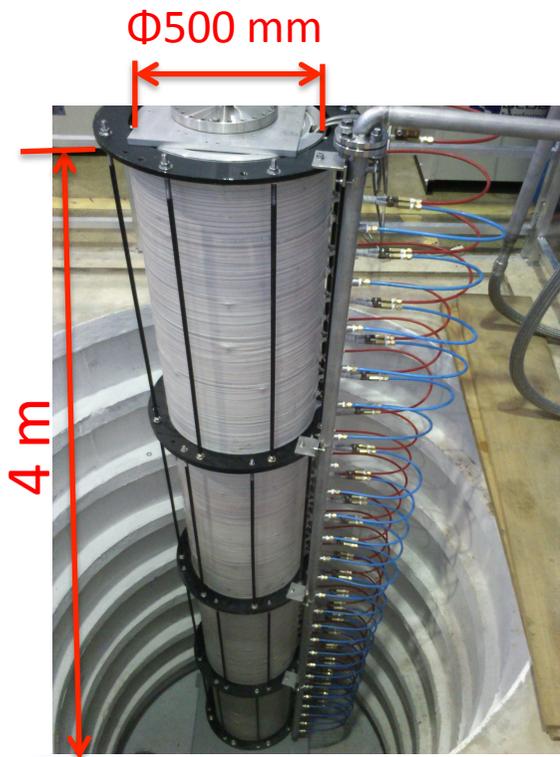

Even quadrupoles with 'pole-tip extensions' have been described by CSIRO (Australia) with application to a nuclear microprobe.

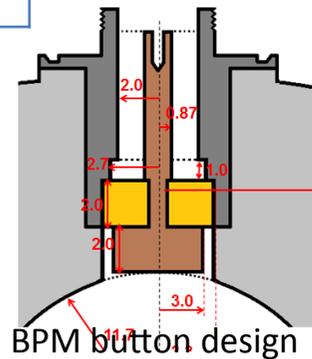

Vaccum system

Chamber material	cooper
Main pumps	NEG coating
Cross-section	circular
Chamber aperture	$\varnothing_{\text{ext}} = 26 \text{ mm}$ $\varnothing_{\text{int}} = 24 \text{ mm}$

- BPM geometry, buttons need to be small
- In-situ NEG activation
- Chemical cleaning procedure for copper
- NEG coating of narrow areas
- Impedance minimization

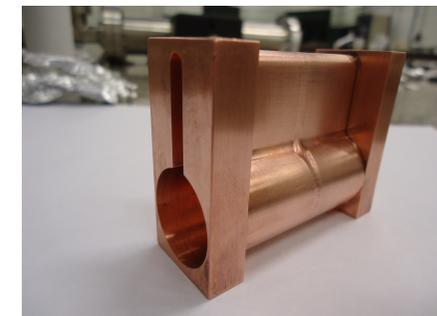

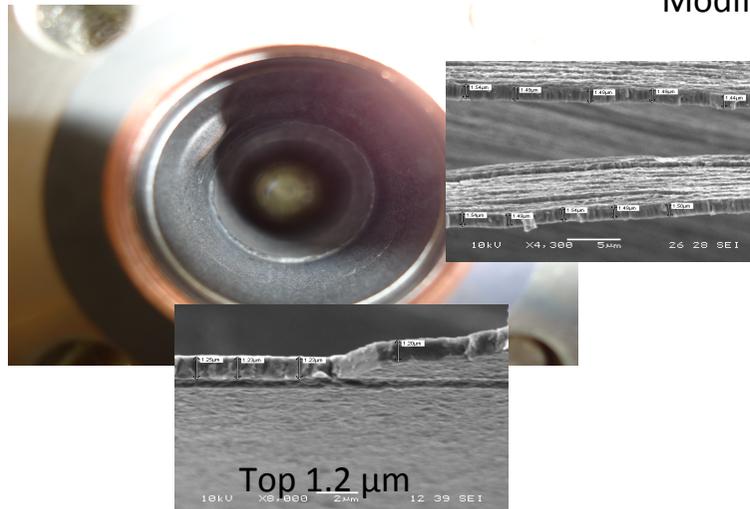

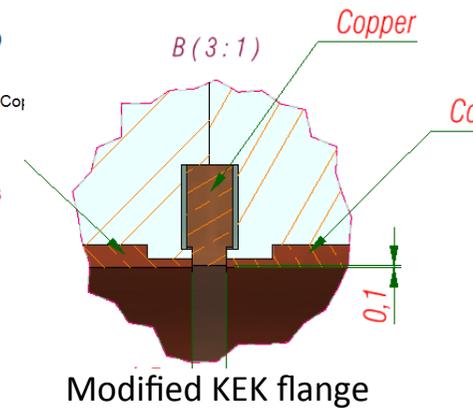

NEG coating setup at LNLS

- Ceramics (BN or AlN)
- Pin (Molybdenum)
- Removable Housing (Co)
- BPM body (Copper)

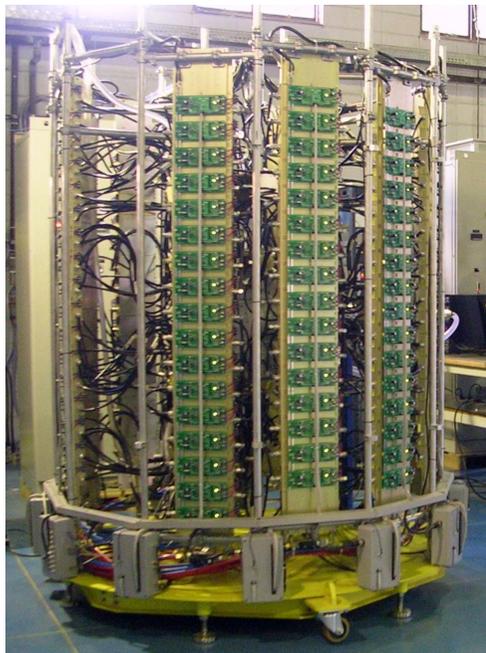

Copper $r_{\text{pin}} = 0.63$

Solid State Amplifiers for RF System

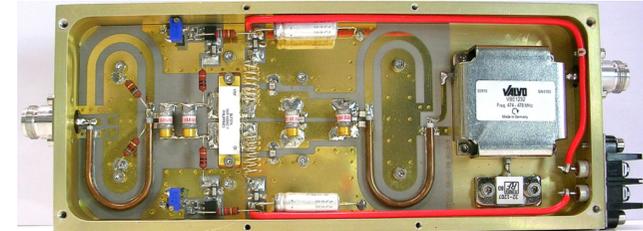

sirius

Tower of the Solid State Amplifier

- 162 Amplifier modules
- 162 DC converters
- 23 Combiners
- 23 Dividers
- 20 Directional couplers
- 391 Coaxial cables
- 1 High power AC/DC converter

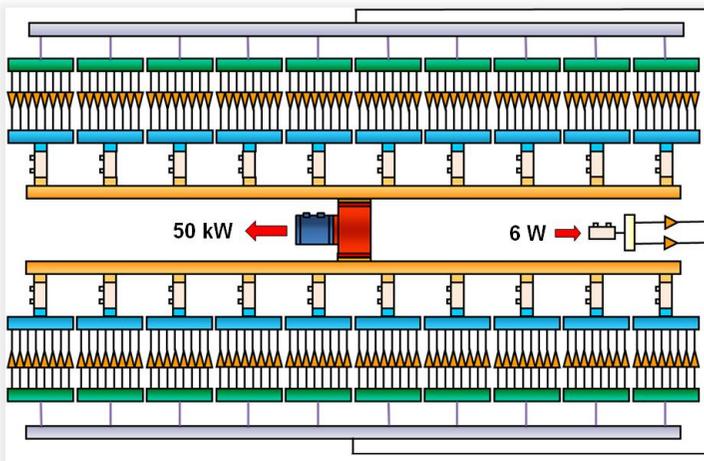

Amplifier module

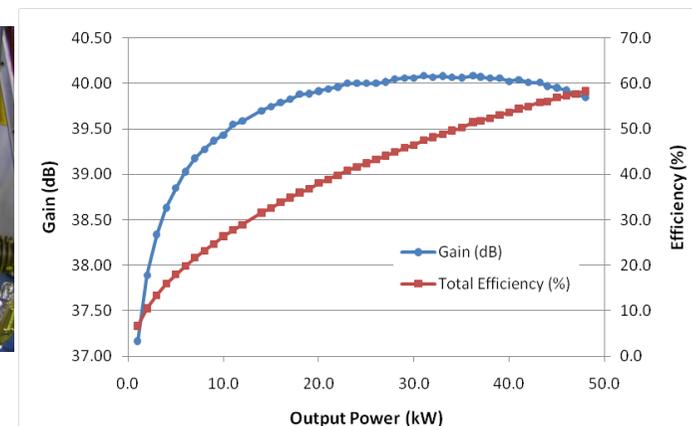

- BLF574 NXP power LDMOS transistor
- $P_{out} = 370 \text{ W (max)}$
- Built-in narrow-band circulator (474-478 MHz)
- Ordered from BBEF, China

DC-DC Converter

Combiners & Directional couplers

Beam stability

- Strong gradient + large number of elements = large orbit amplification factors
- Small emittance

beam stability problems

Horizontal OAF	60
Vertical OAF	86

Stability goal: beam motion < 10% beam size

rms vibration tolerance	7 nm
rms ripple tolerance	20 ppm

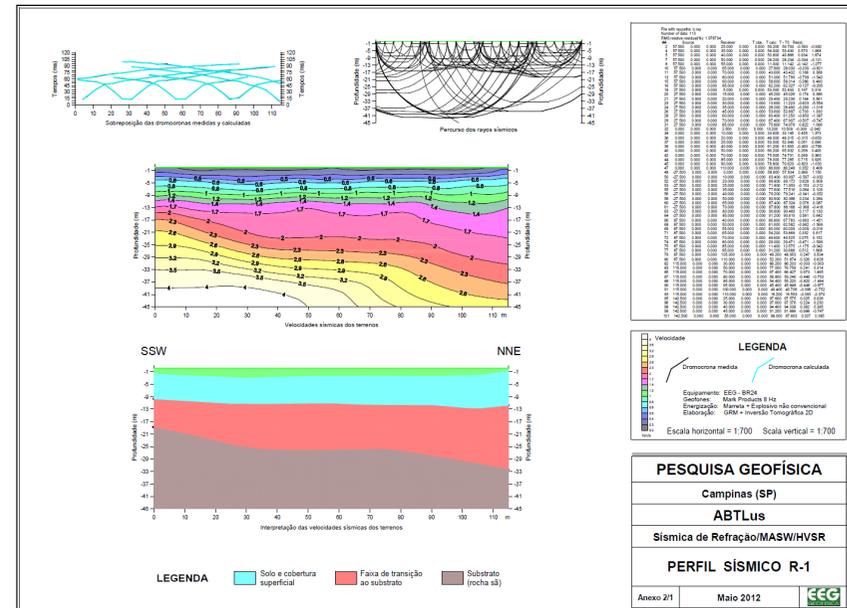

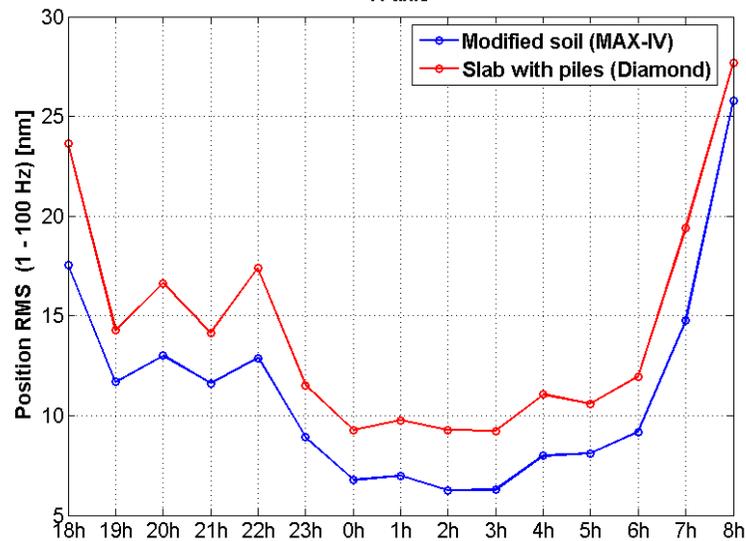

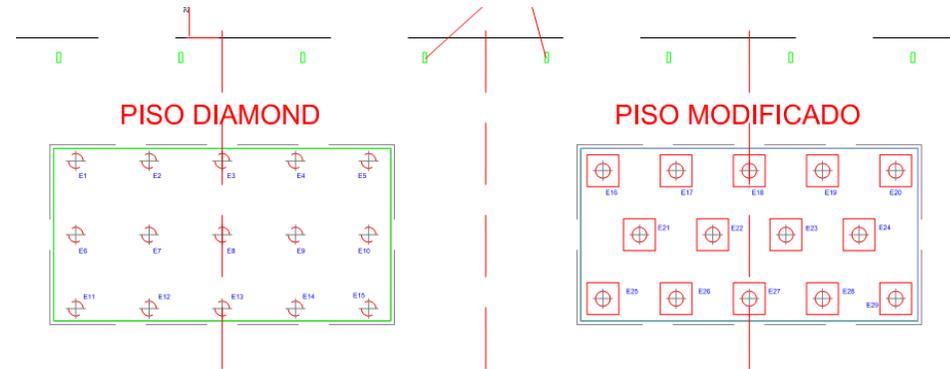

Sources of beam motion

- Ground motion
- Floor motion
- Mechanical vibrations: girders, cranes, compressors, traffic
- ID changes
- booster operation
- Tunnel and hall temperature variations
- Power supply noise
- Transient during injection

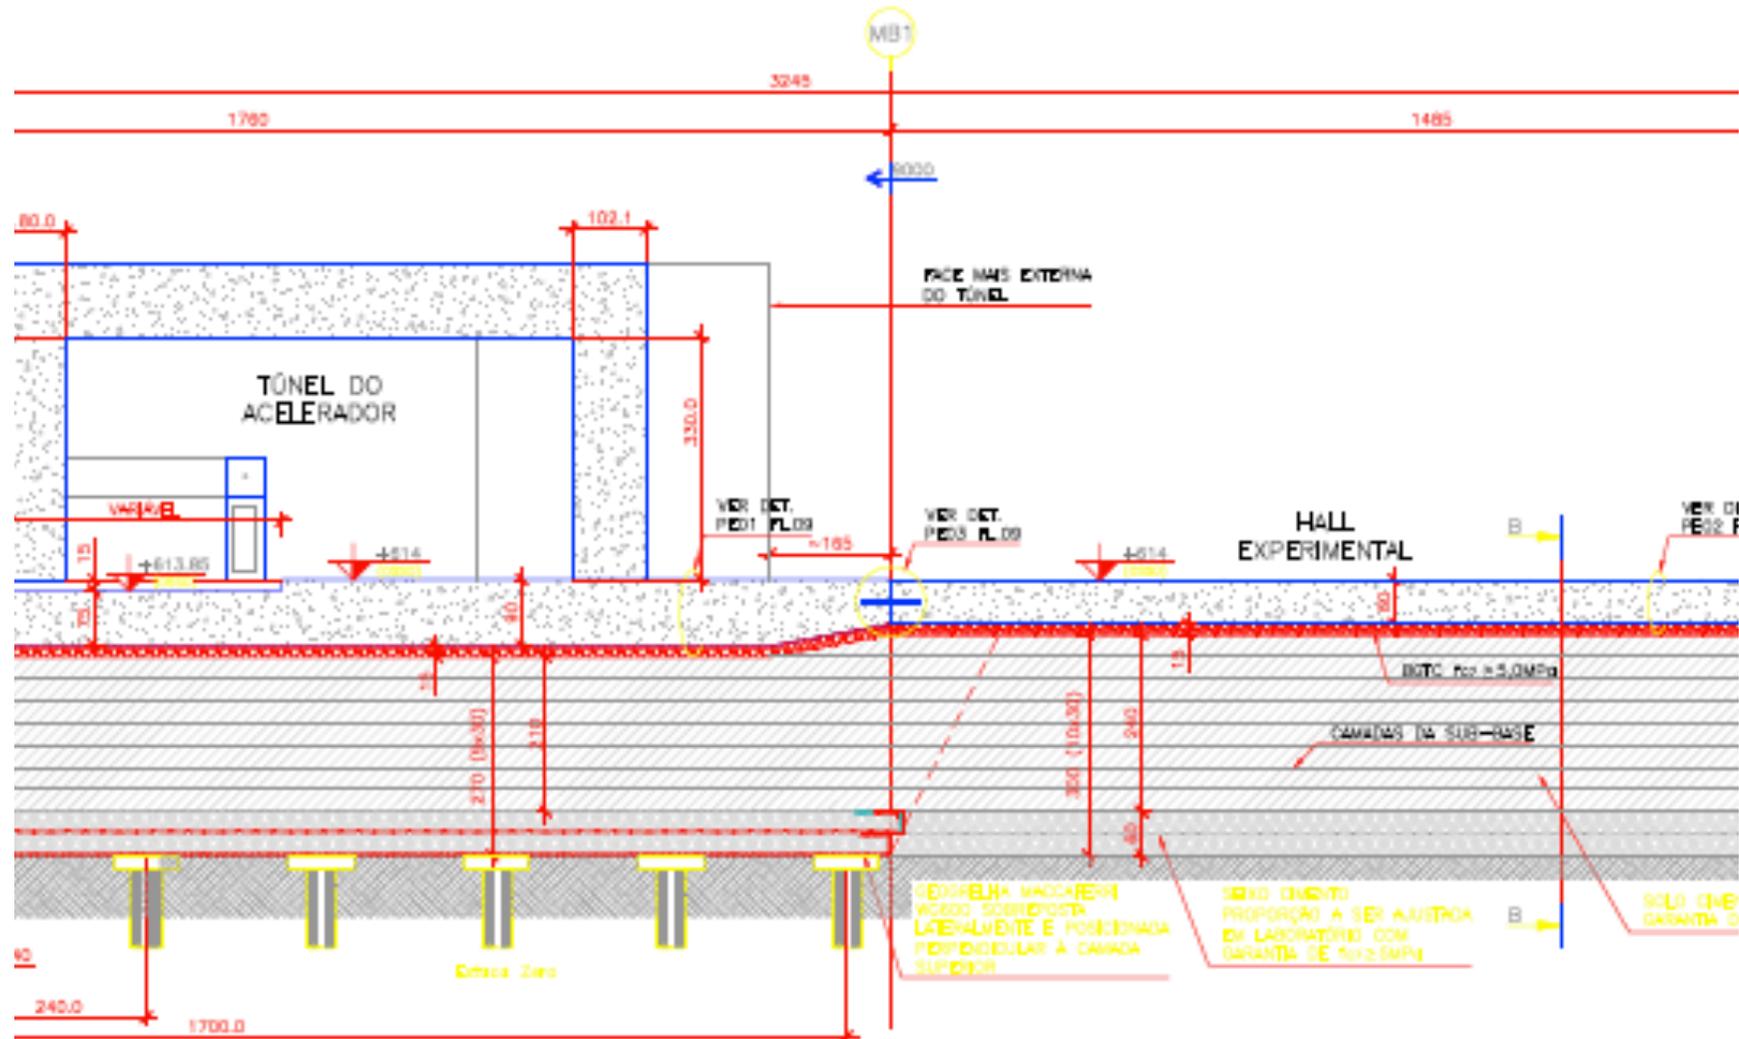

Mitigation

- Building and ground foundation
- Floor structure
- Girder design
- Temperature stabilization
- BPM support
- BPM design
- Slow and fast orbit feedback (1 kHz, ceramic chambers)
- Feedforward
- PMM
- Power supply design

Prototype floor slabs and simulations

Final floor design for Sirius
